

Agentic AI Test Case Generator

Short Reflection

The agent genuinely added value in two areas: broad first-pass scenario generation and independent critique. Instead of manually brainstorming every scenario for 21 acceptance criteria across the two supplied features, the generator created a structured starting point and the critic reviewed coverage, thresholds, timing, state changes, and traceability. The improver then used that critique to produce the final suite.

Compared with writing every case manually, the main time saving is in repetitive ideation and cross-checking. The agent does not replace QA judgment: a human still needs to verify that the generated scenarios match business intent and reject unsupported assumptions. Deterministic Python checks are therefore used as a separate quality gate.

Observed final outputs

Measure	Value
Total test cases	21
Positive	6
Negative	11
Boundary	1
Edge	3
Coverage gaps	0
Final status	PASS

What still requires manual review

Human review remains necessary for business-risk interpretation, environment-specific data, automation feasibility, and any requirement ambiguity. The agent should be treated as an accelerator and reviewer, not as the final authority.
